Time Series Momentum: Method Replication & Extension

Course: Computational Finance (CF2026) | Author: Siyang Yuan (袁思扬, ID: 12411852)
Paper: Moskowitz, Ooi & Pedersen (2012), Time Series Momentum, JFE | Date: October 2026

1. Executive Summary & Key Findings

This project replicates the core methodology of Moskowitz, Ooi & Pedersen (2012) on a surrogate universe of 21 Chinese and cross-border ETFs (79 calendar months, holding periods 2020-02 to 2026-08). We also design an autonomous multi-horizon extension combining 3, 6, and 12-month momentum signals.

Key Empirical Findings (with Tightened Claims):

- Single-Asset Directional Support: 17 out of 21 ETFs (81.0%) achieve positive annualized Sharpe under 12M TSMOM with 0.40/vol scaling (mean Sharpe 0.454), providing partial empirical support for the paper's directional findings (where 58 of 58 global contracts were positive, and 52 of 58 were significant at 5%, p. 236).
- Surrogate Benchmark Divergence: Theoretical 12M TSMOM achieved Sharpe 0.792 (Ann Mean 18.91%), trailing Passive Long (Sharpe 0.986, Ann Mean 24.53%). Sovereign bonds and gold experienced prolonged upward drift where buy-and-hold earned substantial beta carry; meanwhile, domestic equities suffered cyclical whipsaws where short positions during policy rebounds generated adverse carry.
- Asset Class Heterogeneity: Fixed-weight removal attribution proves strategy survival was heavily driven by bond carry (+9.59% ann. contribution; removing bonds cuts Sharpe to 0.371), while domestic equities generated 84.76% of portfolio return variance via covariance decomposition. Testing on broad equity indices alone collapsed Sharpe to 0.052.
- Multi-Horizon Extension Trade-off: Multi-horizon trend combination curtails volatility (23.88% → 22.17%) and drawdown (-35.73% → -33.74%), achieving higher execution Sharpe (1.350 vs 1.303), but sacrifices return during sustained trends and incurs higher turnover (2.35x vs 1.43x).

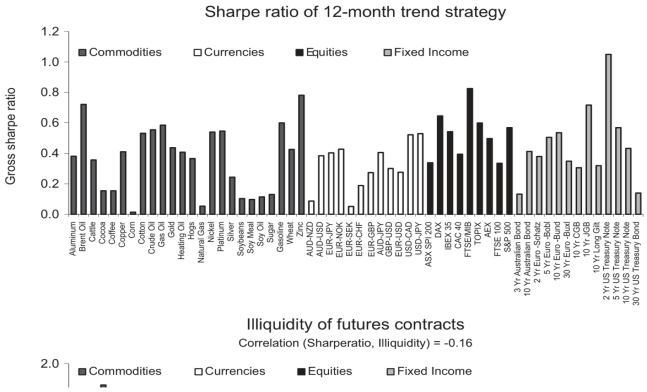

2. Performance Comparison Matrix

Strategy ID	Mode	Ann Mean	Ann Vol	Sharpe	CAGR	Max DD	Win Rate
R1_tsmom12	research	18.9%	23.9%	0.79	17.0%	-35.7%	72.2%
R2_passive_long	research	24.5%	24.9%	0.99	23.9%	-25.6%	64.6%
R3_equal_nominal	research	5.6%	14.5%	0.38	4.6%	-22.7%	57.0%
R4_multi_horizon	research	13.0%	22.2%	0.58	10.8%	-33.7%	68.4%
Bridge_long_only	research	21.7%	15.0%	1.45	22.7%	-12.1%	69.6%
R1_broad_market	research	2.2%	42.4%	0.05	-9.9%	-79.8%	57.0%
T1_tsmom12_3bps	execution	5.2%	4.0%	1.30	5.2%	-4.3%	55.8%
T2_multi_horizon_3bps	execution	4.3%	3.2%	1.35	4.3%	-3.4%	57.2%
O1_aqr_original_reference	reference	17.1%	12.3%	1.38	17.6%	-15.2%	67.3%

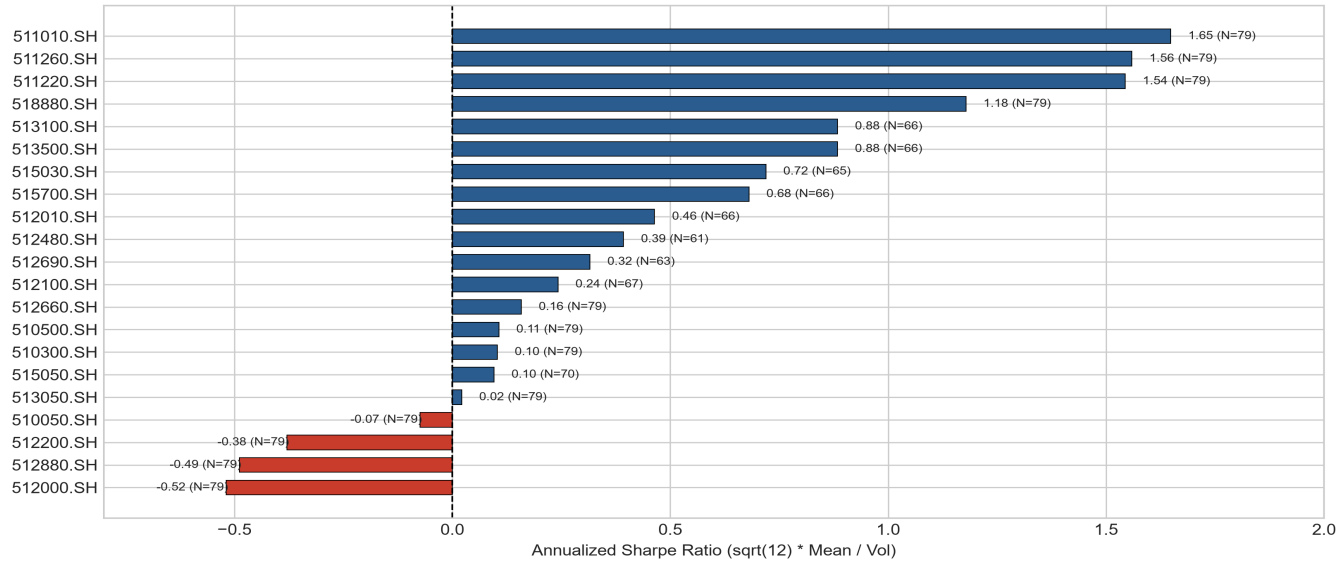

3. Target 1: Single-Asset Sharpe Ratios (Original Fig. 2 vs. Replication)

Replication Analysis: On our surrogate sample of 21 ETFs, 17 of 21 assets (81.0%) demonstrate positive annualized Sharpe ratios under 12M TSMOM. Top performers include sovereign and credit bonds (Sharpe 1.54–1.65, N=79), gold (Sharpe 1.18, N=79), and US equities (Sharpe 0.88, N=66). Underperformers are concentrated in cyclical domestic equity sectors (securities -0.52, real estate -0.38, broker -0.49). This partially supports the original paper's pervasive positive finding while highlighting structural asset class divergence.

Original Paper Fig. 2 (Upper): Single-Contract TSMOM Sharpe Ratios (1985-2009, 58 Futures/Forwards)

Replication: Single-ETF 12M TSMOM Strategy Sharpe Ratios (17/21 Positive = 81.0%)

4. Target 2: Cumulative Portfolio Performance (Original Fig. 3 vs. Replication)

Cumulative Dynamics: In the original paper (Fig. 3, p. 239), diversified TSMOM visibly outperformed passive long buy-and-hold (official AQR factor O1 recalculation yields Sharpe 1.385 and return 17.08%, matching published Table 4 1.38 / 17.1%, while passive benchmark return series is not in public files). On our ETF sample, R1 achieved Sharpe 0.792, but trailed Passive Long R2 (Sharpe 0.986). The divergence stems from the prolonged secular bull market in domestic fixed income and gold, which produced high passive carry, while domestic equities experienced sharp whipsaws where short momentum signals incurred reverse losses.

Original Paper Fig. 3: Cumulative Return of TSMOM vs. Passive Long (1985-2009, 58 Contracts)

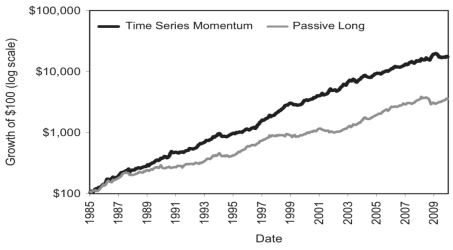

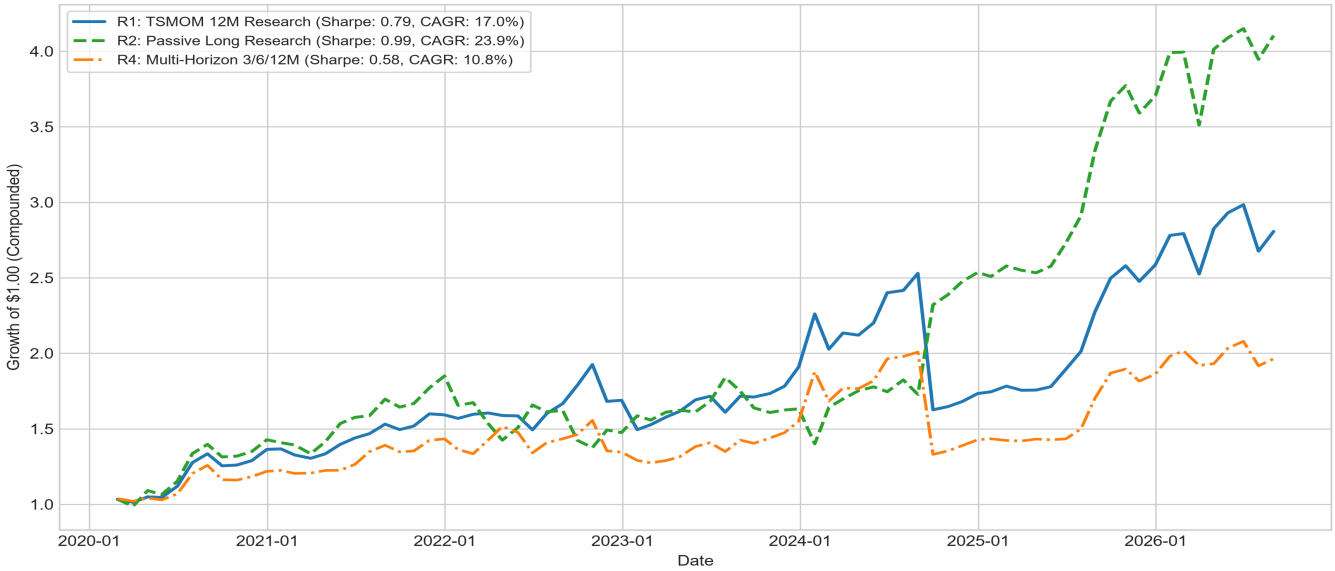

Fig. 3. Cumulative excess return of time series momentum and diversified passive long strategy, January 1985 to December 2009. Plotted are the cumulative excess returns of the diversified TSMOM portfolio and a diversified portfolio of the possible long position in every futures contract we study. The TSMOM portfolio is defined in Eq. (5) and across all futures contracts summed. Sample period is January 1985 to December 2009.

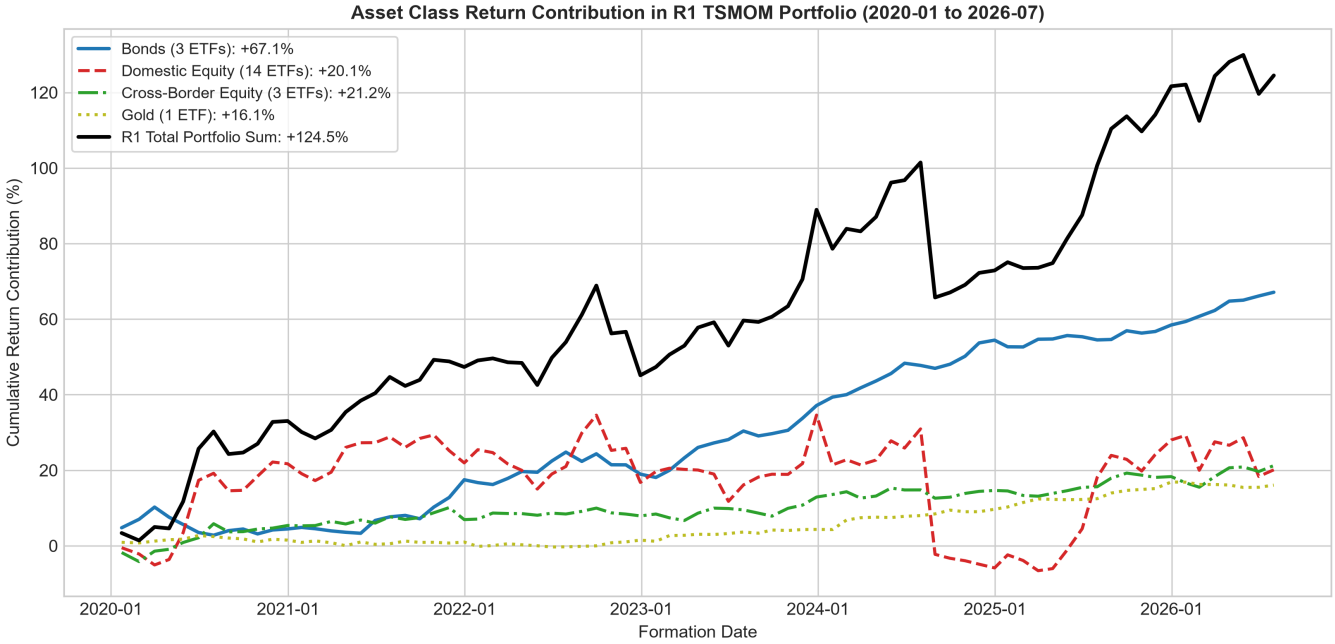

Replication on ETF Sample: Cumulative Performance of Portfolios (2020-02 to 2026-08)

5. Asset Class Contribution & Fixed-Weight Removal Attribution

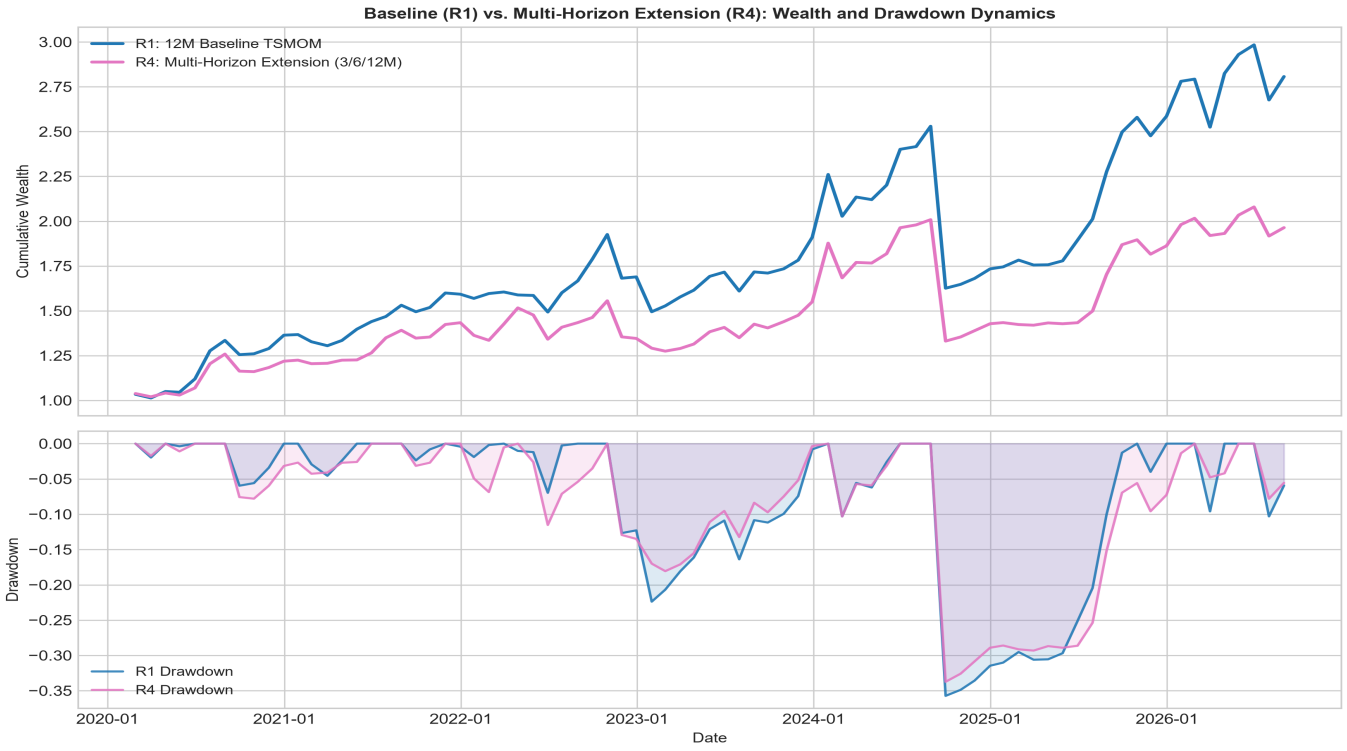

Evidence on Asset Pool Sensitivity: Rather than asserting an unconstrained 'decisive role of broad asset classes', we present concrete attribution data. We decomposed monthly returns across Bonds (3), Gold (1), Cross-Border Equities (3), and Domestic Equities (14), and performed a fixed-weight removal experiment (zeroing out a class's return contribution without re-normalizing other weights).

Scenario	Ann Mean	Ann Vol	Sharpe	Max DD	Diff Sharpe	Empirical Interpretation
Baseline R1 (All 21 Asset	18.9%	23.9%	0.79	-35.7%	+0.00	Full diversified portfolio baseline...

6. Autonomous Extension: Multi-Horizon Trend Combination

Signal Construction & Trade-offs: The multi-horizon signal equally combines 3, 6, and 12-month trend directions: a = (s3 + s6 + s12) / 3. We avoid over-claiming 'comprehensive superiority' and document the explicit trade-off: dampening exposure during turning points reduces portfolio volatility and drawdown, but gives up upside during strong extended trends and increases turnover.

Metric	R1 (12M Res)	R4 (Multi Res)	T1 (12M Exec)	T2 (Multi Exec)	Observed Trade-off
Ann Mean Return	18.91%	12.96%	5.18%	4.25%	Extension reduces upside in strong trends
Annualized Volatility	23.88%	22.17%	3.98%	3.15%	Improved: Lower risk via exposure dampening
Sharpe Ratio	0.792	0.584	1.303	1.350	Improved in realistic execution mode
Max Drawdown	-35.73%	-33.74%	-4.25%	-3.38%	Improved: Substantial drawdown containment
Annual Turnover	N/A	N/A	1.43x	2.35x	Cost: Multi-horizon increases turnover
Total Fees (RMB)	0.0	0.0	3157.7	5154.9	Cost: Higher execution transaction costs
